Applications from an Agent-Oriented Perspective

Agent-Oriented Engineering

Natural and Artificial Intelligence

- ▶ no commonly accepted definition of “intelligence”
- ▶ different, specific forms of intelligence: social, emotional, senso-motoric, mental, etc.
- ▶ the everyday notion of “(human) intelligence” as a starting point of artificial intelligence (AI)
- ▶ indirect goal of AI: computational precision of this everyday notion
- ▶ **AI as a field:** a multidisciplinary field dealing with the design, analysis and application of computer-based systems which deserve to be said to be intelligent

Natural and Artificial Intelligence (Cont'd)

- ▶ **Turing test** (proposed in 1950 by Alan Turing) as a “killer application” for AI
 - ▶ Operational definition of intelligence, indistinguishability from human intelligence
 - ▶ Idea: computer program is intelligent if it answers some questions asked by a person in such a way that this person believes that another person responded. (Questions and responses in written form.)
- ▶ Motivations behind (and requirements on) AI:
 - ▶ **“visionary”**: build artifacts that “produce” intelligent behavior in the same way humans (or animals) do
 - ▶ **“pragmatic”**: build artifacts that show behavior being comparable to human (natural) intelligent behaviorSee chess programs (IBM’s deep blue).
- ▶ **weak AI** (“as if intelligent”) vs. **strong AI** (“actually thinks”)

Some Key Themes treated in AI

- ▶ Knowledge representation
- ▶ natural language processing
- ▶ image interpretation
- ▶ search, problem solving, planning
- ▶ learning
- ▶ theorem proving
- ▶ knowledge-based systems, expert systems (e.g., for diagnosis, configuration and consulting)
- ▶ robotics
- ▶ programming (languages and methods)

AI Perspectives

- ▶ Knowledge-based AI
 - ▶ since 1956 (Dartmouth sommer school – Minsky, McCarthy, Simon, Newell)
 - ▶ **guiding model**: individual human
 - ▶ **guiding assumptions**:
 - ▶ intelligence *is* knowledge representation and processing
 - ▶ von Neumann computer is a perfect model of the human “cognitive apparat”
 - ▶ **symbol system hypothesis**: ability to produce and manipulate symbols is a necessary and sufficient condition for intelligence
 - ▶ **top-down** design of intelligence (start with high-level concepts at the knowledge level and break them down into smaller, programmable units)

AI Perspectives (Cont'd)

- ▶ Behavior-based AI
 - ▶ since about 1985
 - ▶ **guiding model**: individual human, individual animal
 - ▶ **guiding assumptions**:
 - ▶ intelligence is built upon elementary behavioral activities (e.g., moving along a wall, grasping an object)
 - ▶ senso-motoric coupling is essential
 - ▶ **physical grounding hypothesis**: rooting of symbols in the real world (in which the artifact acts) is a necessary condition for intelligence (“no rooting → no meaning → “no intelligent behavior”)
 - ▶ **bottom-up** design of intelligence
 - ▶ related to the field known as **Artificial Life** (field is concerned with creating computational artifacts that deserve to be called alive)

AI Perspectives (Cont'd)

- ▶ Connectionism, Artificial neural networks
 - ▶ about 1950–65, since 1980
 - ▶ **guiding model**: (human) brain
 - ▶ **guiding assumption**: processing of information through very simple but many interconnected units (neurons) that interact at a low (signal-processing) level
 - ▶ **key characteristics**: parallel, distributed and subsymbolic information processing

AI Perspectives (Cont'd)

- ▶ Distributed AI (DAI)
 - ▶ since about 1980 (first international Workshop)
 - ▶ **guiding model**: group of humans, human society
 - ▶ **guiding assumptions**:
 - ▶ intelligent beings do interact, to act together is characteristic to intelligent beings
 - ▶ “no intelligence without interaction”
 - ▶ in contrast to connectionism, the interacting units operate on the knowledge (rather than the signal) level
 - ▶ **key issues**: communication, coordination, cooperation, negotiation, organization(al structure), etc.
 - ▶ Why dealing with distributed (computational) intelligence?
 - ▶ some problems can only (or better) be solved on the basis of high-level interaction among intelligent entities (agents)
 - ▶ parallelism, scalability, robustness
 - ▶ close relationship among intelligence and interaction
 - ▶ intuitively clear approach to complex applications

Outline

Motivation

Artificial Intelligence at a Glance

Agent Orientation

Applications from an Agent-Oriented Perspective

Agent-Oriented Engineering

The Agent Concept

- ▶ No commonly accepted definition of “agent”
 - ▶ applied differently by different people and in different contexts
 - ▶ often based on intuitive understanding and used as in everyday life
- ▶ Emerging **standard view**:

An agent is a (computational) entity that is **situated** in some environment and that is capable of **flexible, autonomous** activity – action and interaction – in order to meet its design objectives.

The Agent Concept (Cont'd)

- ▶ According to this emerging view, **key characteristics** of (computational) agency are:
 - ▶ situatedness
 - ▶ flexibility (reactivity + proactivity, covers problem solving, planning, learning, etc.)
 - ▶ autonomy

The Agent Concept (Cont'd)

- ▶ **Other characteristics** of agency sometimes claimed to be essential:
 - ▶ rationality
 - ▶ mobility
 - ▶ adaptivity
 - ▶ introspection
 - ▶ benevolence
- ▶ Often **mental attitudes** are attached to agency, e.g.
 - ▶ belief, knowledge, ... (information)
 - ▶ intention, plan, commitment, ... (control)
 - ▶ desire, preference, ... (motivation)

The Agent Concept (Cont'd)

- ▶ Agents and Objects
 - ▶ both encapsulate identity (“who”), state (“what”), and passive behavior (“how, if invoked”).
 - ▶ agents additionally encapsulate active behavior (“when”, “why”, “with whom”, “whether at all”)
 - ▶ The agent and object concepts
 - ▶ allow for qualitatively different system perspectives
 - ▶ are concerned with different levels of abstraction
 - ▶ thus are complementary rather than mutually exclusive
 - ▶ Think of a gradual transition from agents to objects, rather than a sharp borderline (→ active object concept, constructs such as preconditioning in Eiffel)

The Agent Concept (Cont'd)

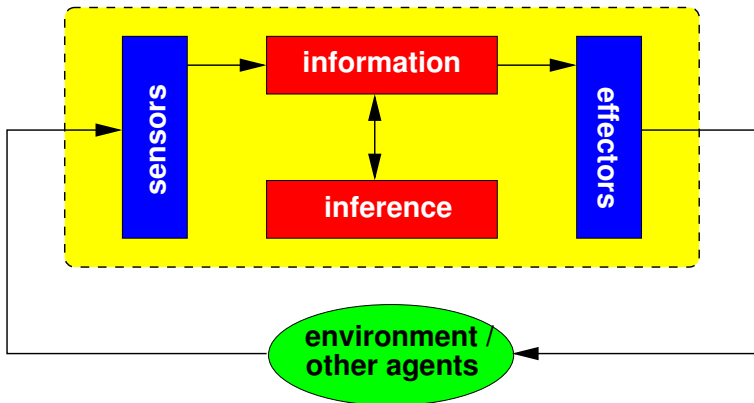

- ▶ Agents and the evolution of programming concepts:

	MONOLITHIC	MODULAR	OO	AO
UNIT BEHAVIOR	nonmodular	modular	modular	modular
UNIT STATE	external	external	internal	internal
UNIT INVOCATION	external	external	external	internal

- ▶ move from machine- to problem-oriented abstractions
- ▶ units show increasing localization and encapsulation
- ▶ thus: agents can be viewed as a natural next step
- ▶ evolution, not revolution

The Agent Concept (Cont'd)

- ▶ Illustrating the Agent Concept:

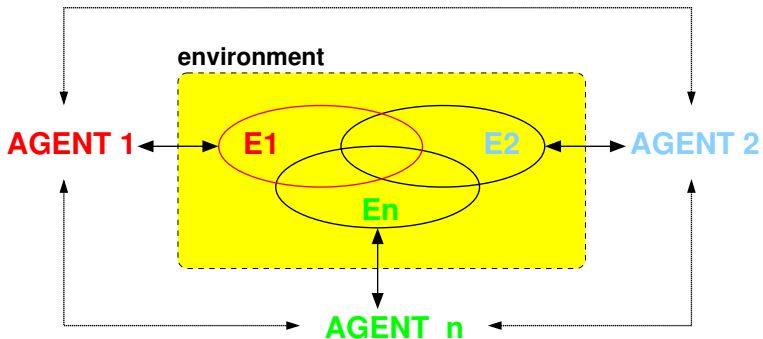

The Multi-Agent Concept

- ▶ Standard view:
 - A multiagent system is a system composed of multiple agents that act and interact to fulfill individual and/or joint design objectives.
- ▶ The key feature is distribution of activities and processes:
 - ▶ distributed sensing and acting
 - ▶ distributed planning, distributed learning, ...
 - ▶ negotiation, conflict handling, ...
 - ▶ communication, ontologies, ...

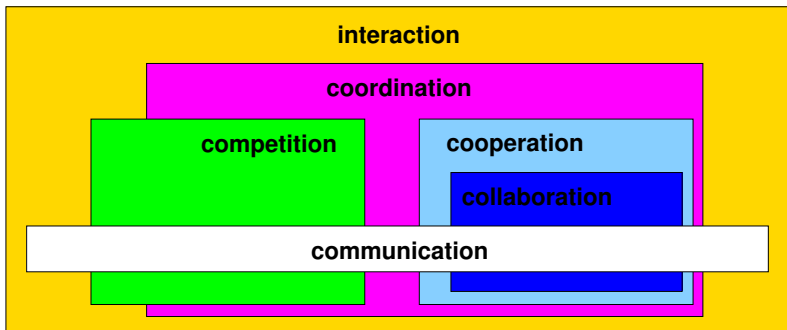

The Multi-Agent Concept (Cont'd)

- ▶ Illustrating the Multi-Agent Concept:

The Multi-Agent Concept (Cont'd)

- ▶ Forms of interaction:

Forms of Interaction (Cont'd)

- ▶ Coordination vs. collaboration (Grosz 1996):

Forms of Interaction (Cont'd)

- ▶ Cooperation vs. sum of individual activities (Grosz 1996):

Forms of Interaction (Cont'd)

- ▶ Interaction vs. collaboration (Grosz 1996):

- Driving in a convoy: a collaboration.

- Driving in Boston:
highly interactive, but not a collaboration.

Outline

Motivation

Artificial Intelligence at a Glance

Agent Orientation

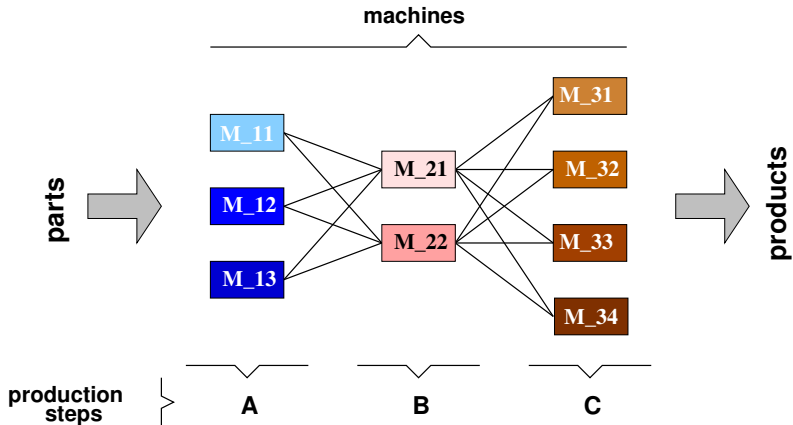

Applications from an Agent-Oriented Perspective

Agent-Oriented Engineering

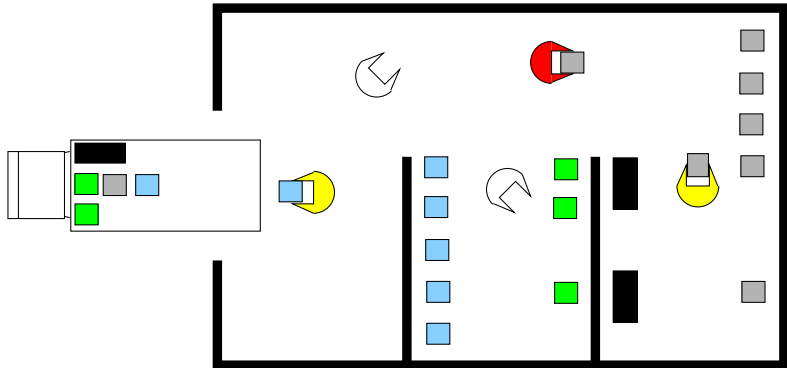

Getting acquainted with the agent-oriented systems perspective

- ▶ **In the following sample applications, identify “agents” and reflect on their ...**
 - ▶ ... flexibility (reactivity and pro-activity)
 - ▶ ... interactivity
 - ▶ ... autonomy
- ▶ **Basic questions to deal with are, e.g.:**
 - ▶ Is the level of agency you identified appropriate?
 - ▶ Desirable planning and learning abilities of the agents?
 - ▶ Information to be exchanged among the agents?
 - ▶ In how far and to what extent should the agents be autonomous?

Automated production process

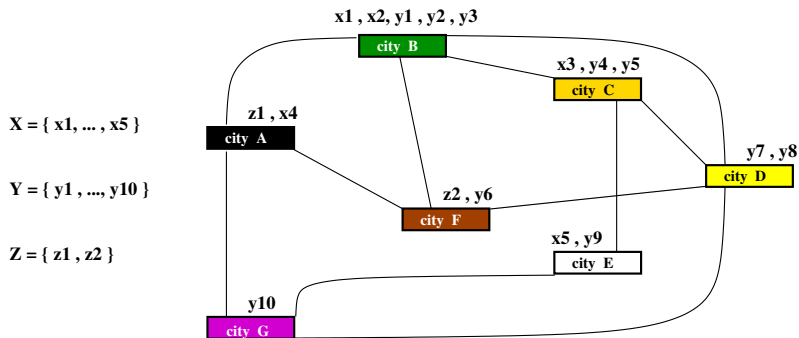

Docking station

Traffic flow regulation

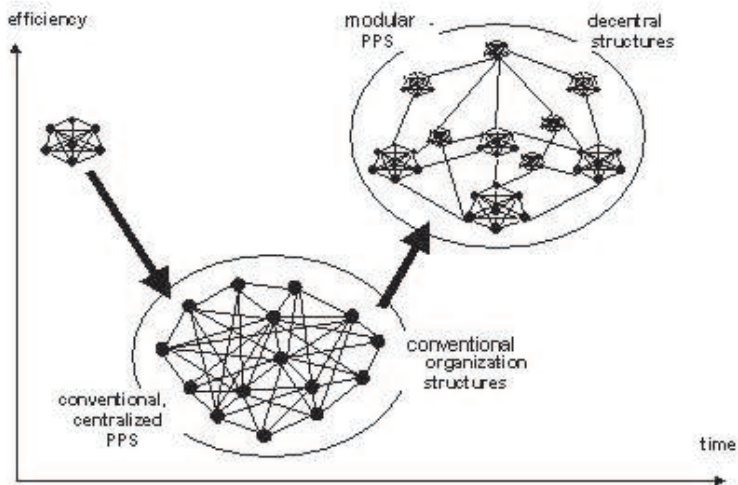

Transportation, logistics

Robotics

Supply chain management

Personal software assistants

Games – “Blocks World”

agents

Games – “Predator-Prey”

Concluding remarks

- ▶ **Further examples of application domains:**

- ▶ logistics
- ▶ telecommunication
- ▶ autonomous vehicles
- ▶ interactive games (avatars)

- ▶ **Features in which applications differ:**

- ▶ *environment*: diversity, dynamics, predictability, ...
- ▶ *agents*: number, homogeneity, goals, ...
- ▶ *interaction*: frequency, levels, patterns, ...

Concluding Remarks (Cont'd)

An application is particularly well suited for agent-oriented engineering if it involves multiple components which

- ▶ are not all known a priori
- ▶ can not all be assumed to be fully controllable
- ▶ must interact on a sophisticated level of communication and coordination to fulfill their individual or joint design objectives.

Outline

Motivation

Artificial Intelligence at a Glance

Agent Orientation

Applications from an Agent-Oriented Perspective

Agent-Oriented Engineering

Benefits of Agent-Oriented Engineering

- ▶ parallelism, robustness, scalability
- ▶ distribution of data, control, expertise, resources
- ▶ broad range of potential applications, well suited for open domains
- ▶ natural next step in evolution of programming models
- ▶ technology for realizing agent-oriented systems is available
- ▶ offer techniques (identified by Booch) for tackling increasing software complexity:
decomposition – abstraction – hierarchy/organisation
- ▶ interactivity and intelligence are closely related

Pitfalls of Agent-Oriented Engineering

There is no “silver bullet” in software engineering –
you should not ...

- ▶ ... oversell agents.
- ▶ ... see agents everywhere.
- ▶ ... get religious about agents.
- ▶ ... confuse buzzwords with concepts.
- ▶ ... forget to exploit related technology.
- ▶ ... forget you are developing software.

Levels of Agent-Oriented Engineering

- ▶ **Three levels** that must be addressed:
 - ▶ 1st (intra-agent): “What is within a single agent?”
 - ▶ 2nd (inter-agent): “What happens between individual agents?”
 - ▶ 3rd (supra-agent): “What is the social/organizational structure in which the agents act and their interactions take place?”
- ▶ These levels are related

Levels of Agent-Oriented Engineering (Cont'd)

- ▶ Another way of illustrating the relationships among these three levels:
